EXAMINER'S AMENDMENT

1. An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Godfrey Audrey Kwan on May 1, 2007.

The application has been amended as follows:

Claim 13: A fibre channel switch, comprising: a fibre channel line card coupled to an external fibre channel network entity; a first supervisor coupled to the fibre channel line card through a backplane; a second supervisor coupled to the first supervisor; wherein the first supervisor is operable to receive a message from the external fibre channel network entity that alters the state of the first supervisor and send an acknowledgement to the external fibre channel network entity before the message is passed to the second supervisor, the first supervisor operable to ~~send the second supervisor a sequence number to indicate that the second supervisor should expect the message, wherein the second supervisor performs a maintenance operation if the second supervisor does not receive the message~~ determine high availability characteristics associated with the message, wherein high availability characteristics provide information for synchronizing the second supervisor in the fibre channel switch with the first supervisor, wherein a high availability characteristic table is referenced using a message type to determine persistent, logged, and mirrored characteristics associated with the message.

2. The following is an examiner's statement of reasons for allowance:

A search of the prior art revealed determining high availability data in a fibre channel switch, but the search did not produced a method wherein a high availability characteristics table is referenced using a message type to determine persistent, logged, and mirrored characteristics associated with the message.

Chong et al (US 6,070,251), discloses a high availability method in fibre channel switch. Chong failed to disclose that a high availability characteristics table is referenced using a message type to determine persistent, logged, and mirrored characteristics associated with the message. Applicant's claimed invention distinguishes over Chong in these ways.

Lubbers et al (US 6,931,487B2) disclosed a availability characteristics associated with a message. Lubbers failed to disclose that a high availability characteristics table is referenced using a message type to determine persistent, logged, and mirrored characteristics associated with the message. Applicant's claimed invention distinguishes over Lubber in these ways.
